

Aristotelian Logic
Hegelian Logic.

09-04-2025

African Logic.

Logic is understood as the laws of thought, the rule for right reasoning and also the principles guiding the way we think. This basic level of logic is particular to every human being for possessing reason, hence every human being possesses the principles of logic.

However, it should be noted that this rule guiding logic as posited initially by Aristotelian Logic is not limited to this Western idea or understanding of logic. This is clear from the fact that the initial explanation of logic by Aristotle has disputed by Hegel in his proposition of Hegelian logic (Dialectical Logic). Therefore the question of logic as understood from a particular perspective is flawed.

It is from this fact that it makes sense to speak of African Logic which is particular to the African people according to the consistency of their rationality, and the coherence within their rationality.

Peter Winch argued that the rationality of traditional mode of thought should not be confused with the Western conception of logic of science or science of logic, by implication any traditional mode of reasoning has within it a logical system of thought.

* This means that there is an inherent logic way of thinking, particular to various traditions. For him, there are different paradigms which are specific to various cultures, however there is no paradigm which is higher or above the other. It is based on these arguments and position that is justified to talk of African logic. He proposed that there are consistent, and coherent ways in which people reason within their paradigms which makes them logical different from others.

He identified within each paradigm a level of consistency which each group used, he uses the instance of magic-religious paradigm which may seem illogical to the westerners. He therefore accepts the fact of African logic, which does not have to be western to be logical. Every language/culture consist an inherent logic which every language identify with and as such they develop logic according to their context.

Rationality is the same, however the specific way various people make use of this rationality is different based on the language and cultural background. Therefore, we can say that "Logic is considered as that pattern of ~~dis~~ thoughts found in everyday discuss of a people"

African Logic deals with thinking, language or the inferences people make which are all in direct reference to their culture.

Ijioma stated that "Logic is the science of the relationship among levels of realities; given that reality differs from one culture to another, it follows that logic differs from one culture to another." - However, he tries to emphasise on the difference in how people interpret reality which is ~~diff~~ unique to them. Hence, there are different approaches to reality.

There are three criteria which have been identified as a means of identifying African Logic; which are.

1. Origin.
2. Domicile
3. Interest.

These three criteria are important, since African Logic can grow from the cultural context of people, this means that the ideas should origin from the context of the people, as well as residing in the culture of the people. However, interest plays a more essential role since with interest, one cannot actually develop African Logic.

By origin, we mean that the concept being used must evolve ~~with~~ ^{be part of them.} ~~be part of them.~~ By domicile, it is only inherent and peculiar to the people and.

2. African soil, by interest it means that it focuses its tentacles of justification on African terms, and concept.

Every culture has its own problems, hence the contents of African Logic must correspond to the three criteria to be able to address the various African problems.

It is important to note that developing African Logic does not seek to contradict Western Logic, but rather to increase and to amplify knowledge. This is a challenge to African scholars; to unravel and develop the inherent logical reasoning that are specific to and address Africans lived experiences
